Imaging in the immuno-oncology era: between immune response, pseudoprogression and hyperprogression:

what do we have to know?

COLUMBIA | COLUMBIA UNIVERSITY IRVING MEDICAL CENTER

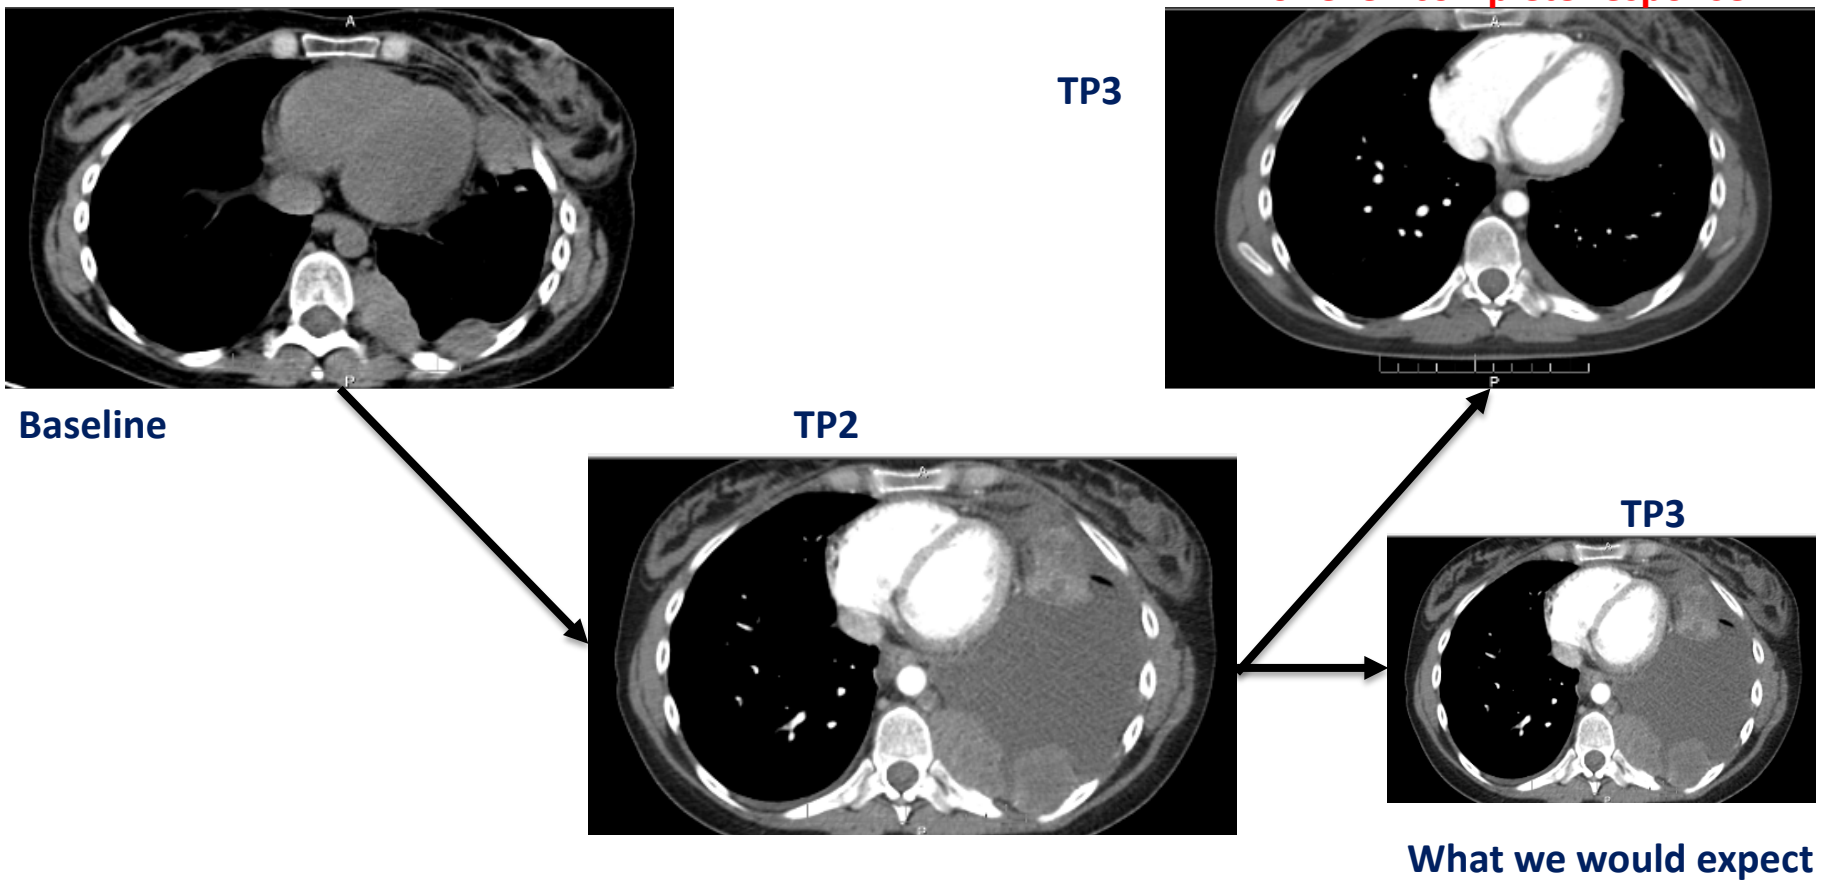
Unusual Response Patterns

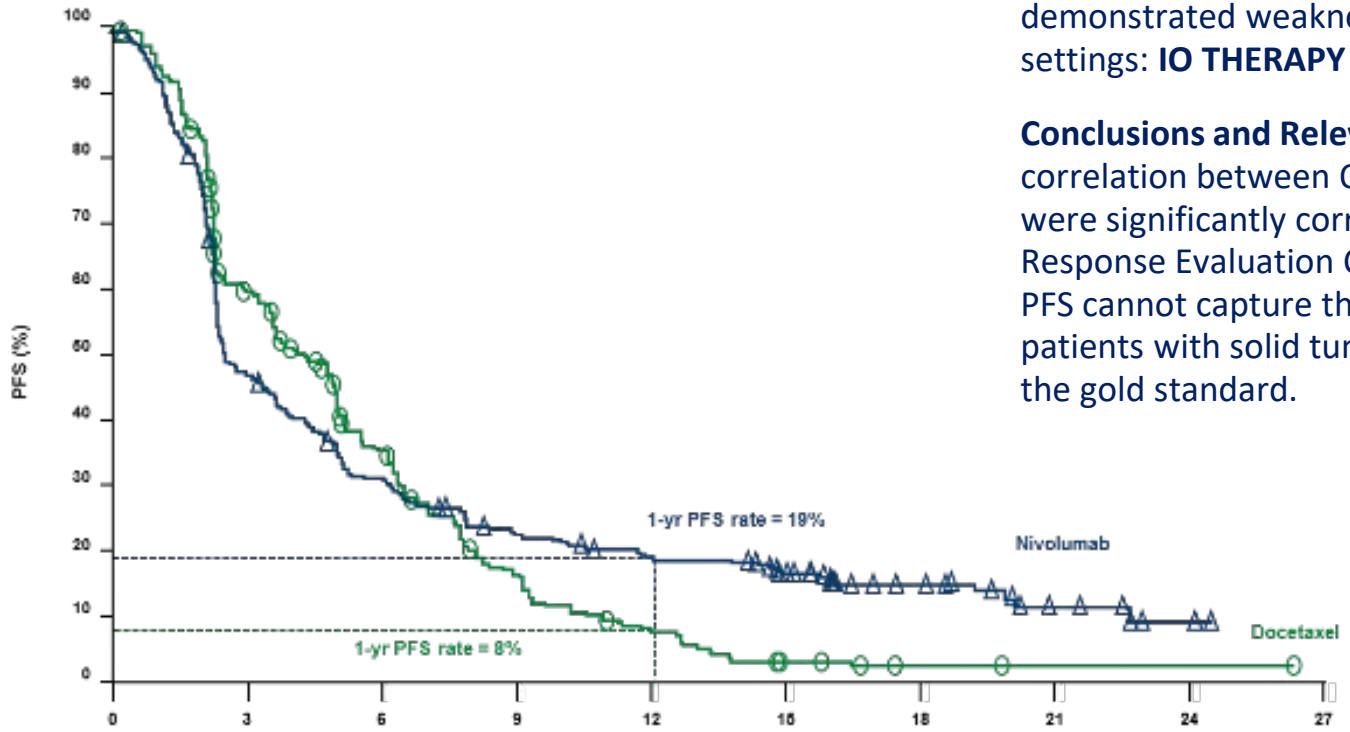


Response and Immunotherapy

- **We know**
  - Unusual response patterns well described *especially in melanoma*
  - Immune based therapies are a major advancement in patient care, as access to immunotherapies increases, OS will be increasingly confounded as a primary endpoint in randomized studies due to crossover, so reliance of PFS will be critical
  - Recent analyses of randomized studies indicate that immunotherapies may yield an improvement in OS with minimal or no improvement in PFS, as assessed by RECIST 1.1

Response and Immunotherapy

- **We don’t know**
  - True frequency of unusual response patterns
  - Optimal response criteria or how to implement them



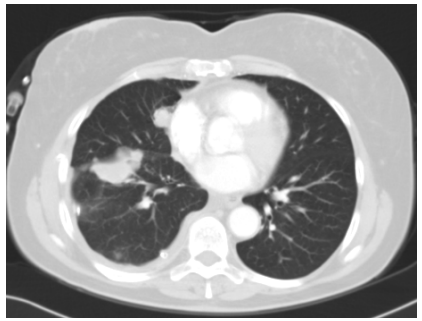
RECIST progression free survival (PFS) has demonstrated weaknesses across a number of settings: **IO THERAPY**

Conclusions and Relevance There was no significant correlation between OS and PFS … but their HRs were significantly correlated. …..Traditional Response Evaluation Criteria in Solid Tumors–based PFS cannot capture the benefit of PD-1 inhibitors in patients with solid tumors, and OS should remain the gold standard.

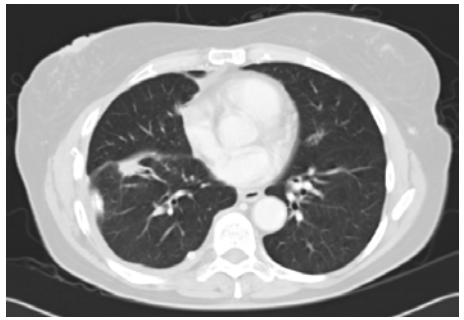
CheckMate 057 trial, Paz-Arez et al, ASCO, 2015 JAMA Network Open. 2018;1(2):e180416

Variable Presentation of Progressive Disease Complicates Assessment

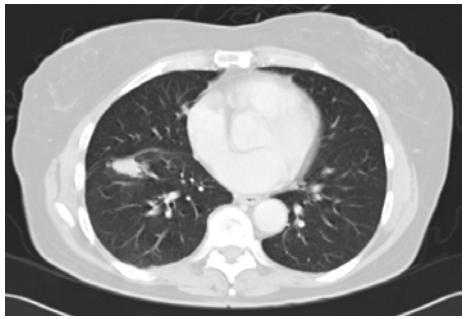
Example 1



Baseline



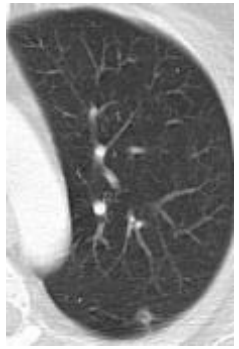
3m: Response



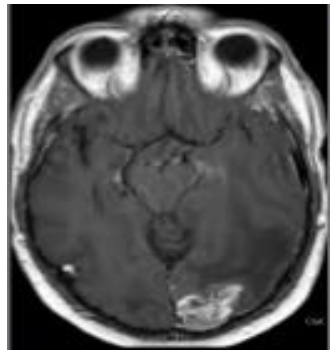
14m: RECIST PD

30m: Follow-up

Example 2



Baseline



Cycle 4

Are these two PD's the same ?

Oxnard et al, ASCO, 2012

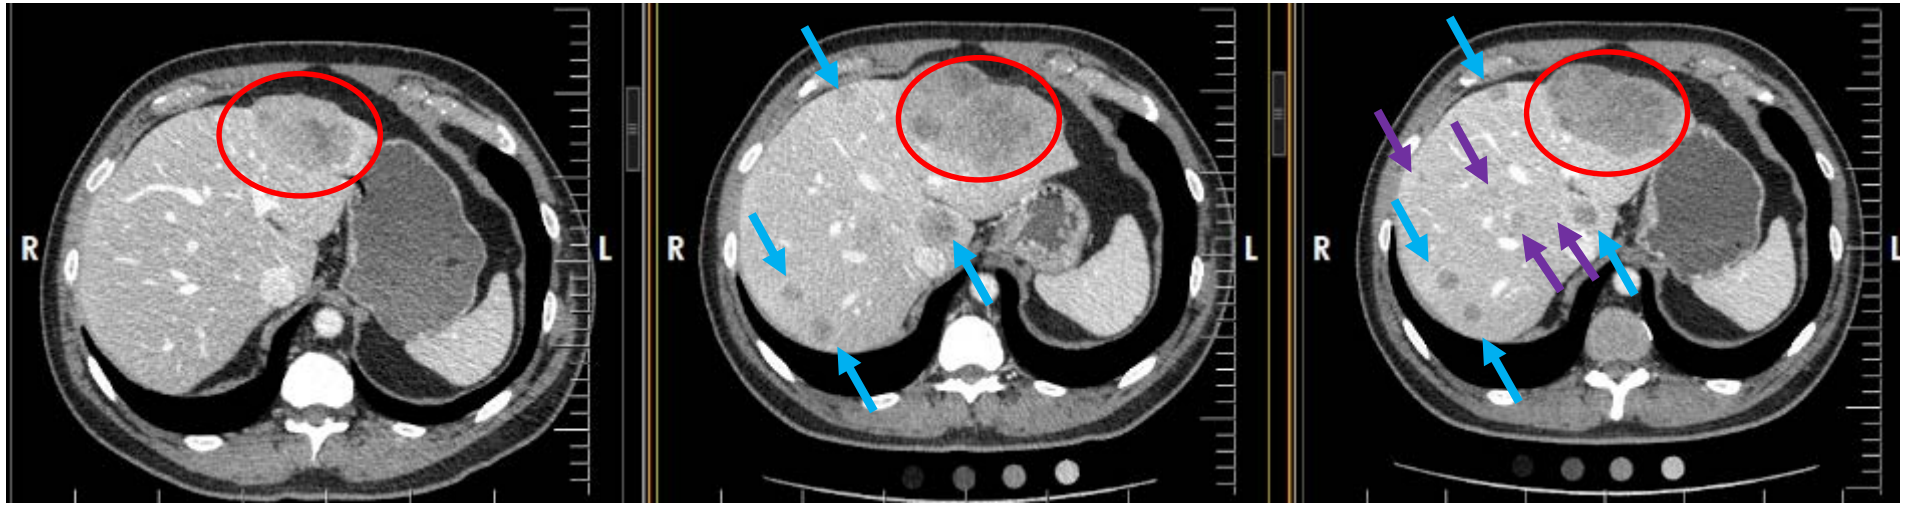
Background: Immune Response Criteria

- irRC - ***consensus*** based recommendations (2009)
  - Based on WHO, bi-dimensional measures
  - New lesion measures included in sum of measures of target lesions
- Subsequent modifications proposed
  - Based on RECIST/RECIST 1.1

Wolchok JD, et al. *Clin Cancer Res*. 2009;15:7412–20.

Variable Presentation of Progressive Disease Complicates Assessment

- The irRC are guidelines but are not definitive rules:



Baseline

Cycle 2 – SD or PD

Cycle 4
Confirming PD ?

- irRC / irRECIST are based more on instinct rather than outcomes correlations
- Analysis of existing imaging and outcomes can standardize and optimize irRECIST

Response Criteria Summarized

	RECIST 1.1	irRC (+ unidimensional variant)	"irRECIST /irRECIST1.1" variants
Bi/unidimen.?	Unidimensional	**Bidimensional**	Unidimensional
N Target	5	**15; (≥5 × 5mm)**	10 / 5 (≥10mm/ ≥10mm (15 for nodes))
New target lesions added to sum or measures (SOM)?	No	(≥5 × 5mm); **Yes** - does not automatically define PD	(RECIST or RECIST 1.1 rules) **Yes**
How many ?	NA	10 visceral, 5 cutaneous	10 / 5 (RECIST 1.1 rules)
Definition of progression (PD)	≥ 20% ↑ compared to nadir (≥ 5mm ↑)	≥ 25% ↑ compared to baseline (BL), nadir/**reset BL**	≥ 20% ↑ compared to nadir (≥ 5mm ↑)
Confirmation ?	No	Yes, required	Yes, recommended
How confirmed?	NA	**Not defined**	**Not defined;** not improved? Imager feels is worse?

The Tower of Babel !

iRECIST Addresses

- Standardise data management and collection - develop consensus guidelines (termed iRECIST)
- Recommendations on
  - Terminology (“i” prefix)
  - Data to be collected after RECIST 1.1 defined PD
  - Definition of “events”
  - Primary endpoints versus exploratory endpoints
- They are not treatment decision guidelines
- These are not (yet) validated response criteria
- They are internationally agreed data recommendations from academia, pharma and regulatory authorities

iRECIST vs RECIST 1.1: **Unchanged**

RECIST 1.1	iRECIST
Definitions of measurable, non-measurable disease	√
Definitions of target (T) and non target (NT) lesions	√
Measurement and management of nodal disease	√
Calculation of the sum of measurement (SOM)	√
Definitions of CR, PR, SD and their duration	√
Confirmation of CR and PR	√
Definition of progression in T and NT (iRECIST terms i-unconfirmed progression (iUPD))	√

iRECIST vs RECIST 1.1: **Changes**

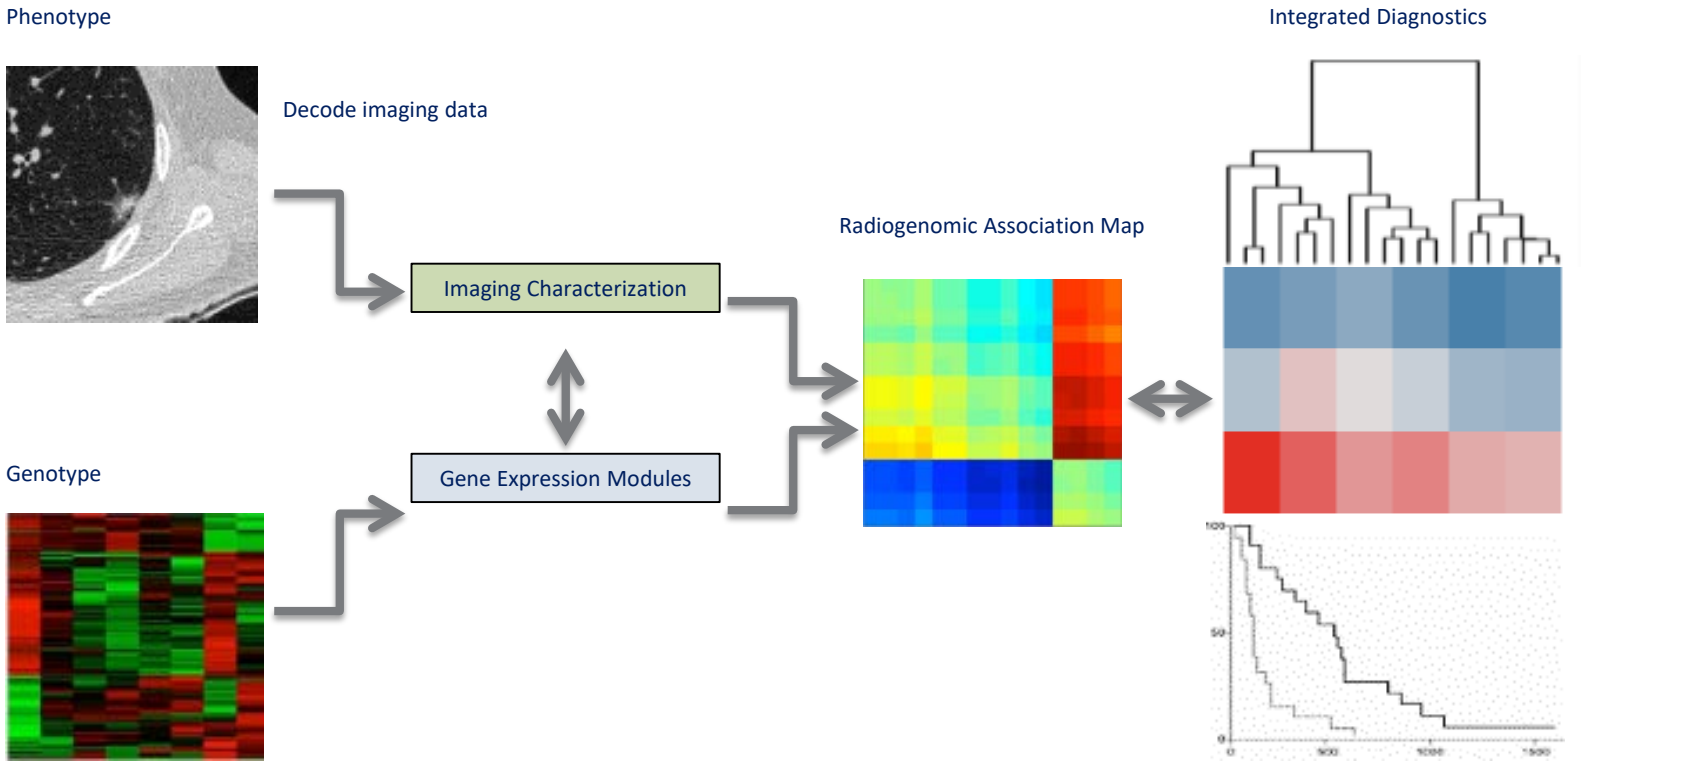
RECIST 1.1	iRECIST
Management of new lesions	**NEW**
Time point response after RECIST 1.1 progression	**NEW**
Confirmation of progression required	**NEW**
Collection of reason why progression cannot be confirmed	**NEW**
Inclusion and recording of clinical status	**NEW**

iRECIST vs RECIST 1.1: Changes

- Treatment past PD should only be considered if patient clinically stable*
  - No worsening of performance status.
  - No clinically relevant ↑in disease related symptoms
  - No requirement for intensified management of disease related symptoms (analgesics, radiation, palliative care)
- Record the reason iUPD not confirmed
  - Not stable
  - Treatment stopped but patient not reassessed/imaging not performed
  - iCPD never occurs
  - Patient has died

* recommendation – may be protocol specific

Radiomics and immune-related patterns of response



- Quantitative molecular imaging provides a potential platform for linking specific imaging traits with specific gene expression patterns that inform the underlying cellular pathophysiology
- Imaging features may serve as molecular surrogates that contribute to the diagnosis, prognosis, and likely gene-expression-associated treatment response of various forms of human cancer

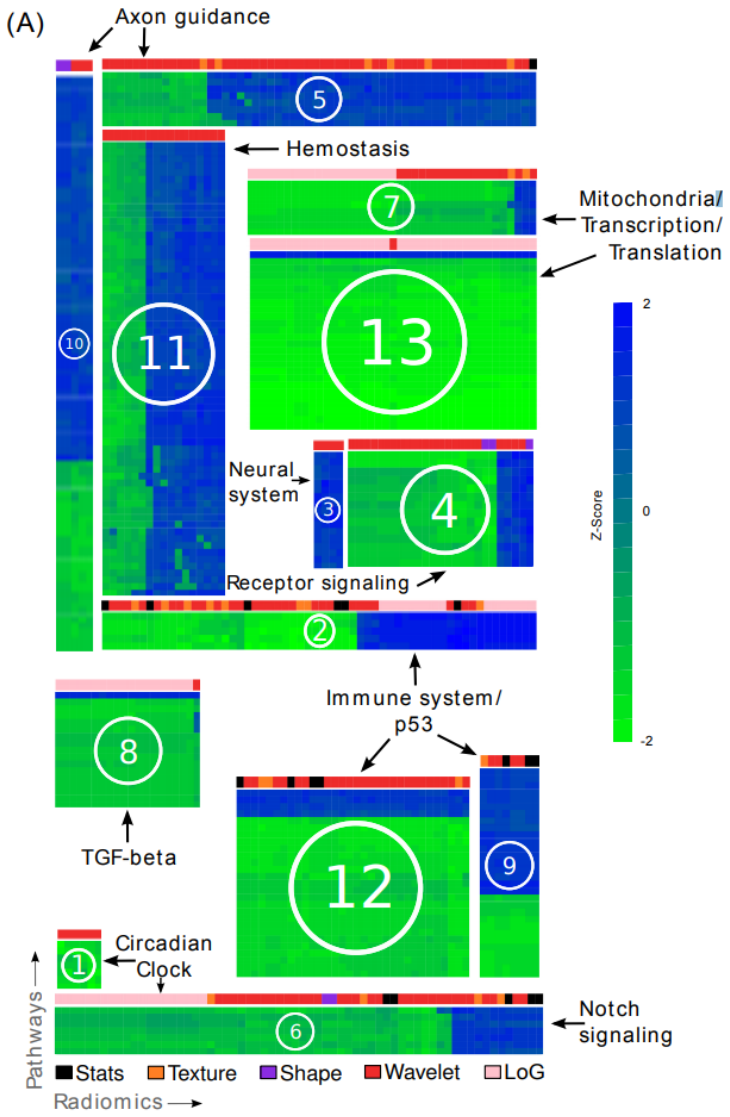
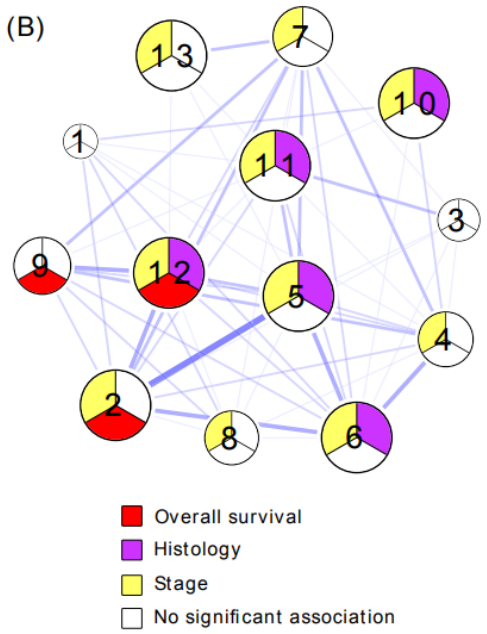
Defining the biological basis of radiomic phenotypes in lung cancer





Module	nr	np	Radiomic	Pathway
M1	6	7	Wavelet texture gray-level runs	Lipid and lipoprotein metabolism, Notch signaling, circadian clock
M2	58	5	Wavelet intensity entropy; Laplace of Gaussian intensity standard deviation	Immune system, p53
M3	4	17	Wavelet minimum intensity	Neural system, axon guidance
M4	25	14	Intensity variance and mean; wavelet minimum intensity min	Biological oxidations, signaling by insulin receptor, signaling by GPCR, neuronal system
M5	58	8	Wavelet texture gray-level runs; wavelet intensity range and median; (wavelet) texture information correlation and cluster tendency	Axon guidance and synaptic transmission, lipoprotein metabolism, cell type determination
M6	64	7	Laplace of Gaussian standard deviation; wavelet texture gray-level runs; wavelet texture cluster tendency	Circadian clock, signaling by Notch
M7	39	8	Laplace of Gaussian intensity entropy; wavelet intensity variance; Laplace of Gaussian texture information correlation	Mitochondria, Pol III transcription
M8	20	17	Laplace of Gaussian standard deviation	TCA cycle and electron transport, TGF-beta receptor signaling, response to stress, transcription regulation, protein synthesis,
M9	8	30	Intensity variance; wavelet intensity variance	Immune system, p53, cell cycle regulation checkpoints, cell-cell interaction, circadian clock
M10	5	83	Shape surface (SH); wavelet texture gray-level runs	Axon guidance, neuronal system, (innate) immune system, hemostasis, FGFR signaling, TGF-beta receptor signaling, Notch signaling, circadian clock
M11	17	66	Wavelet intensity range; wavelet texture information correlation	Hemostasis, neural system
M12	32	27	Wavelet texture entropy; intensity variance; wavelet texture cluster tendency	P53, immune system
M13	39	26	Intensity entropy	Gene expression regulation, Pol II/III transcription

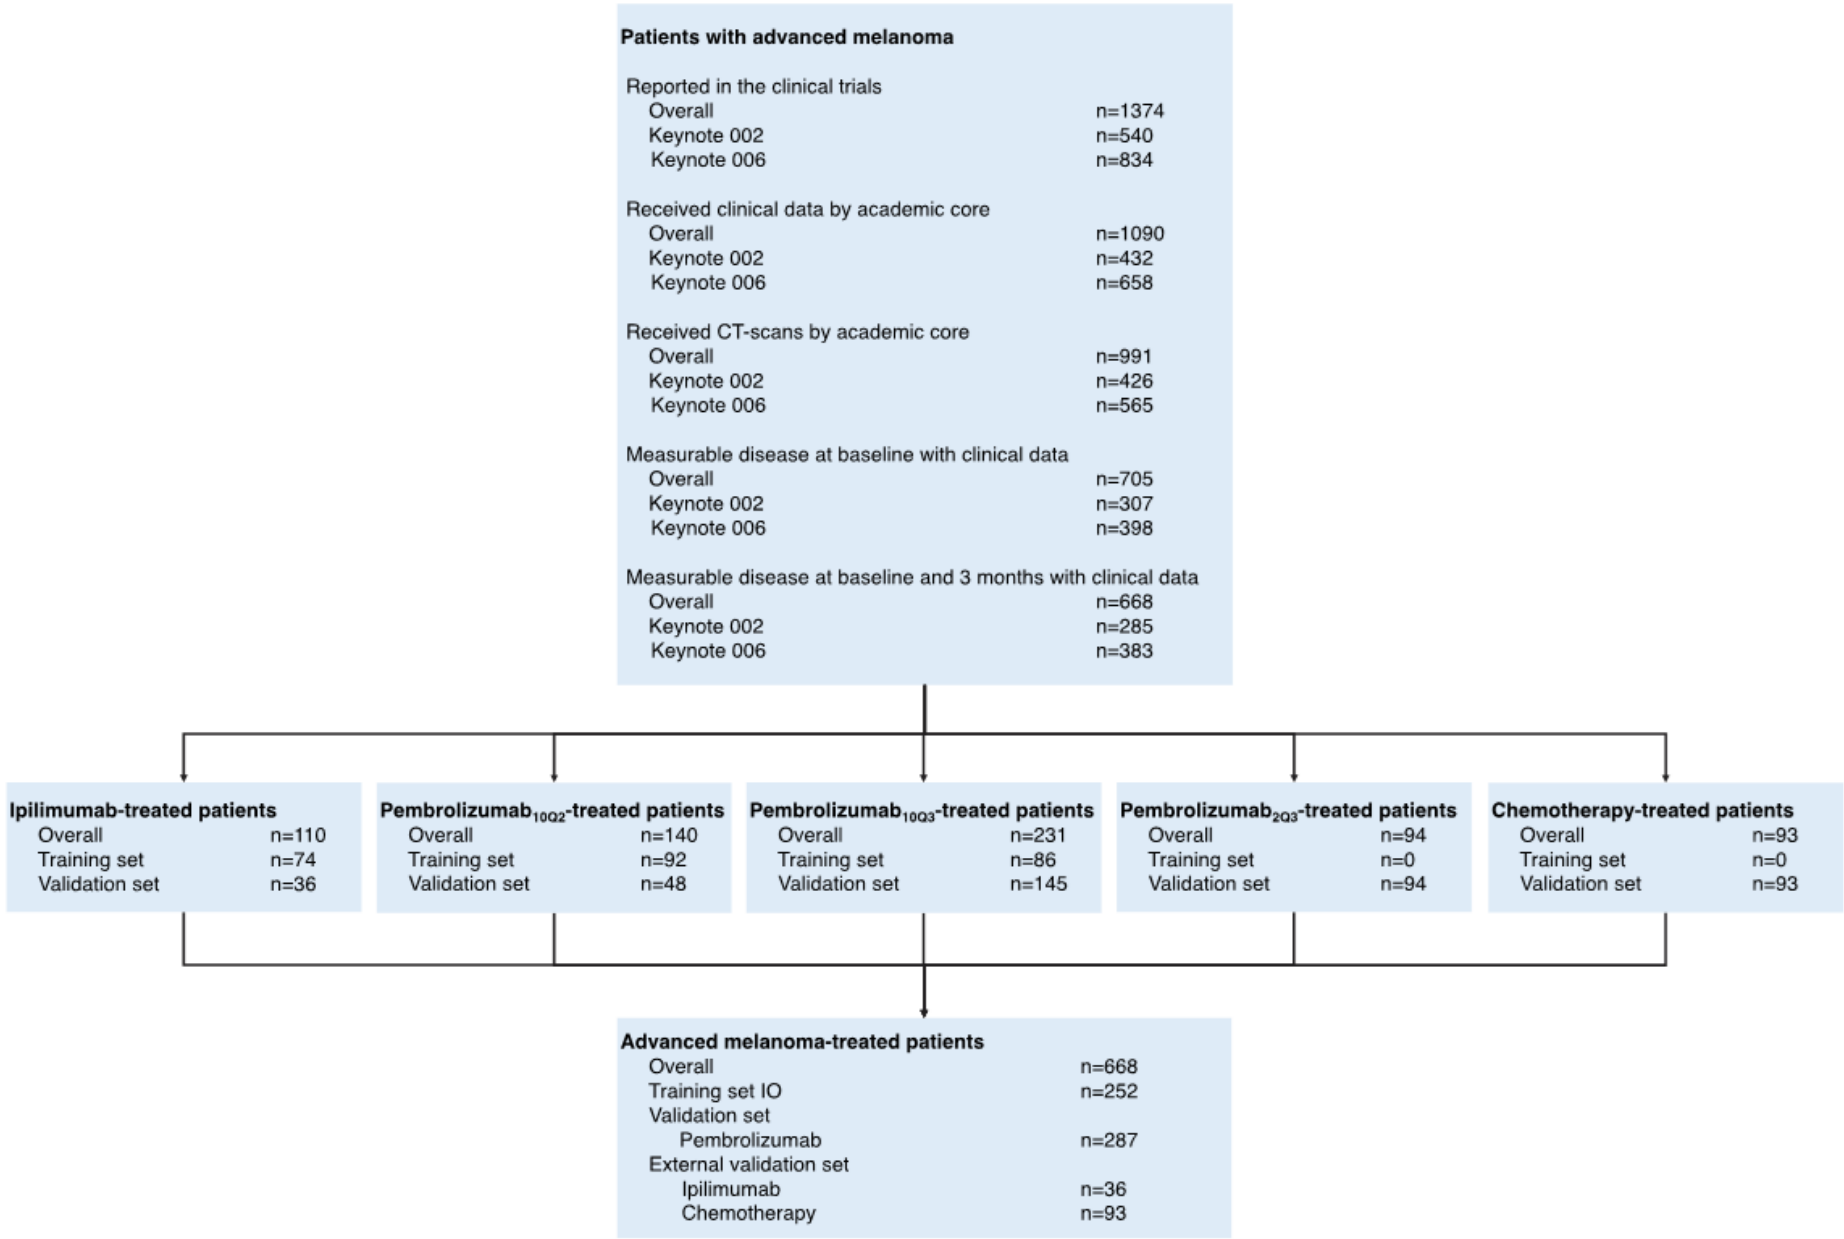
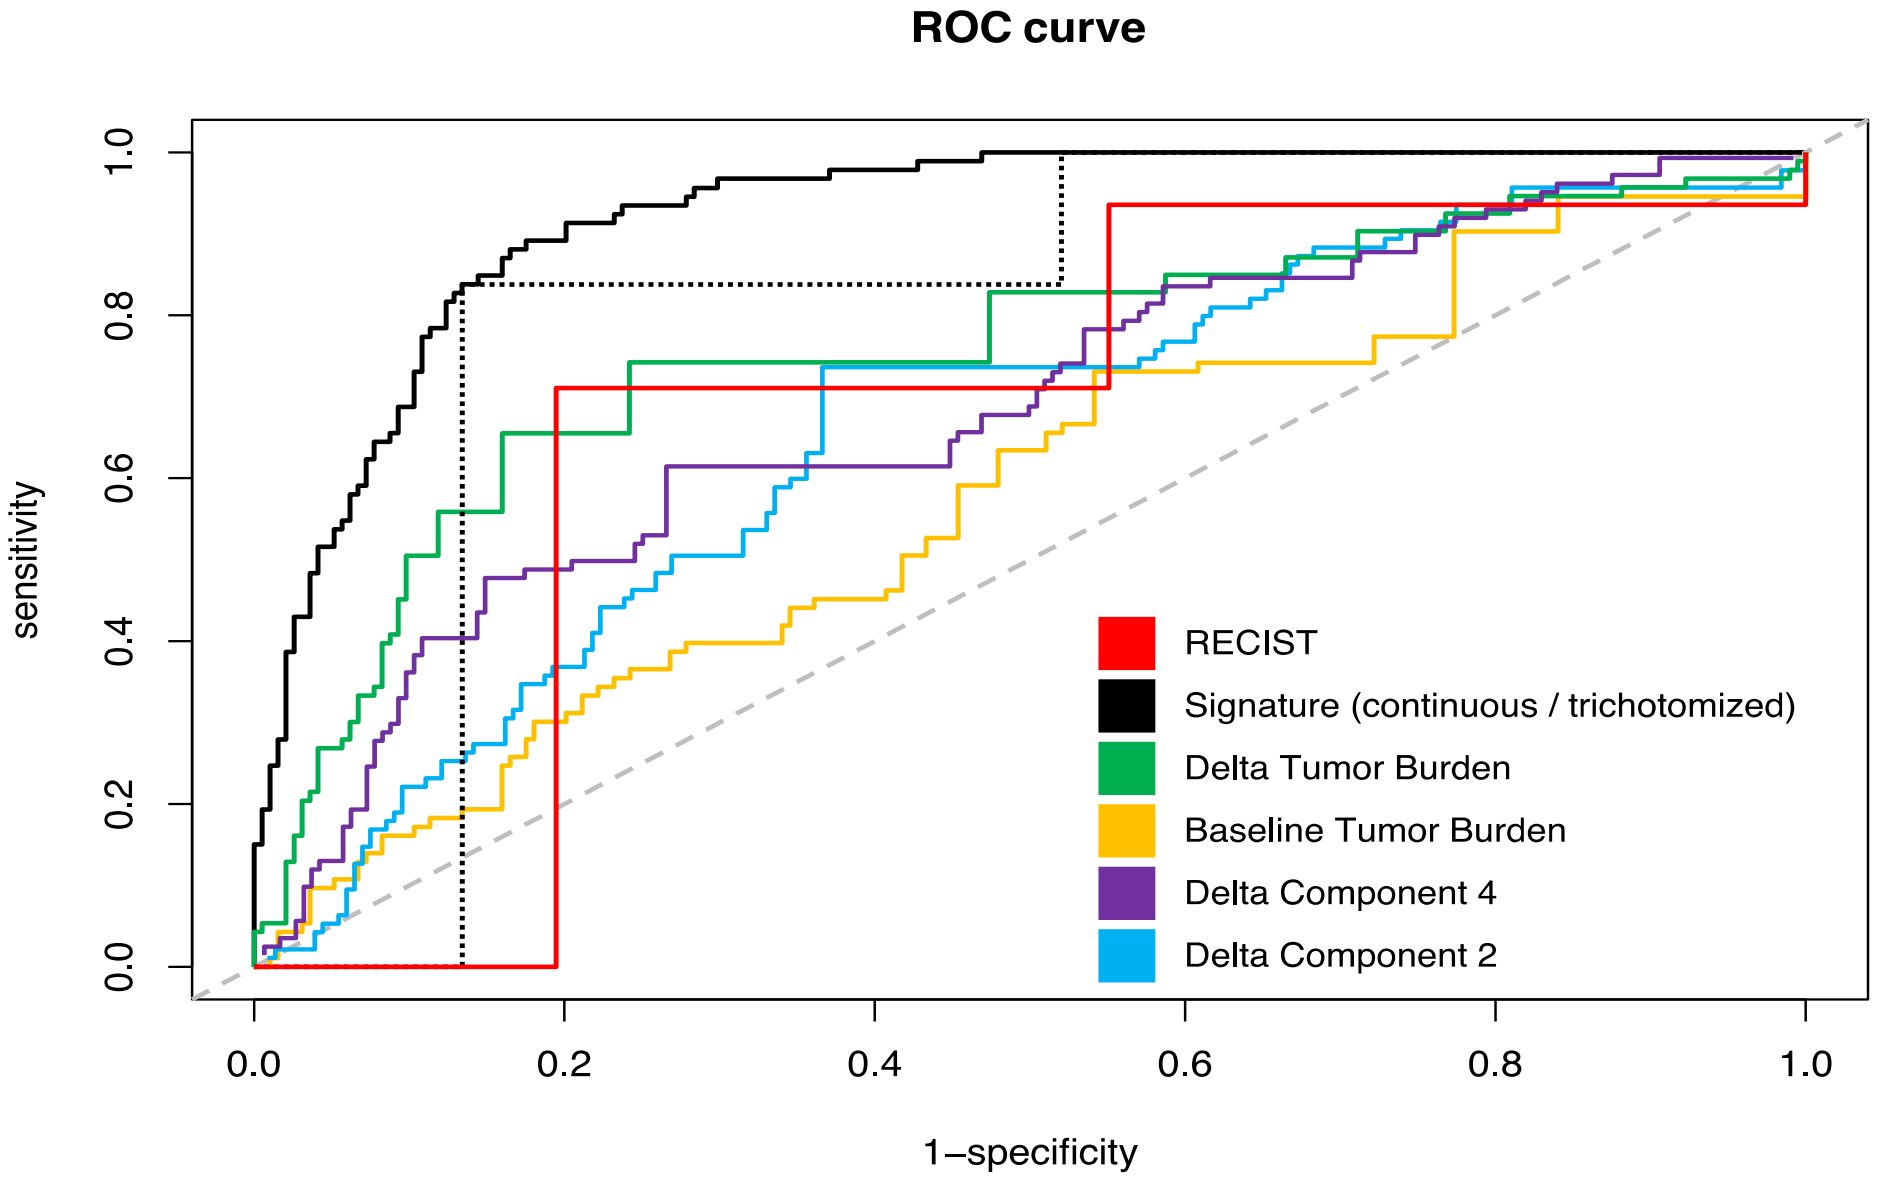
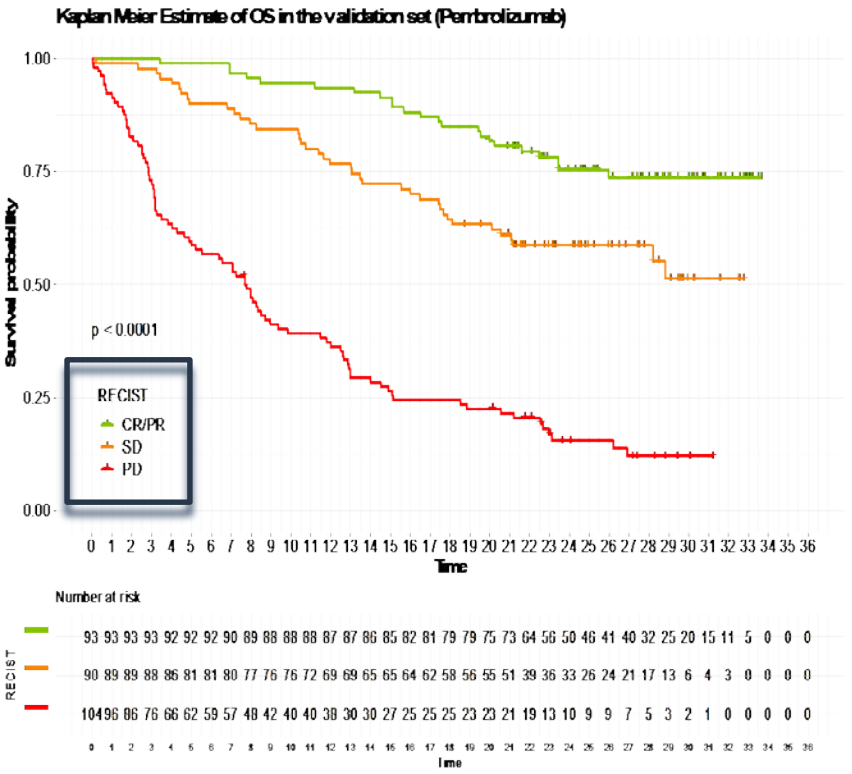
Radiomic Change Analysis – IO - Melanoma

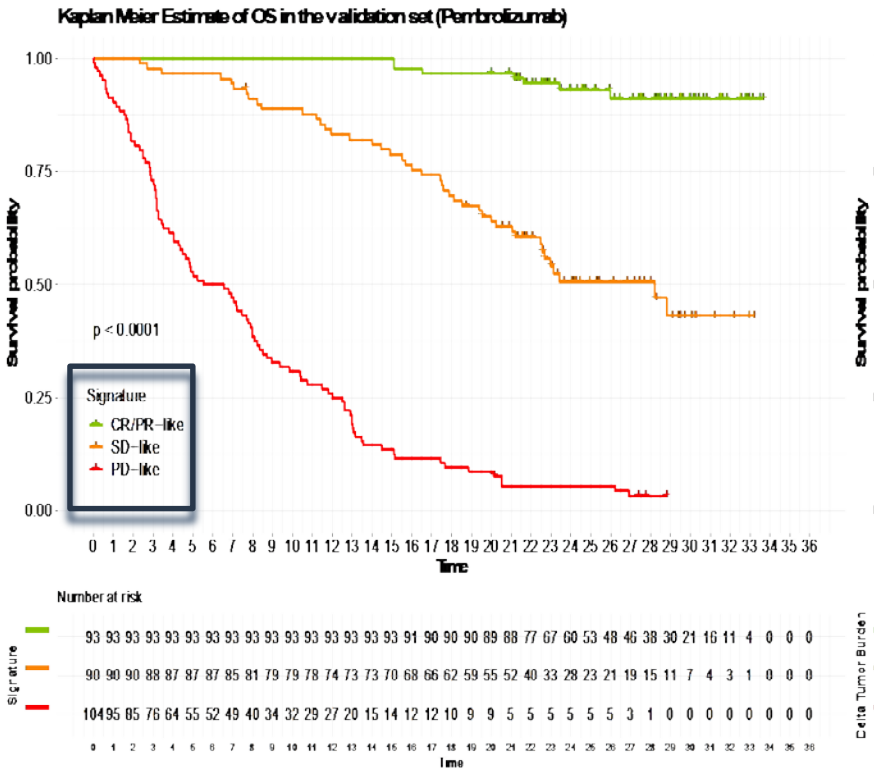


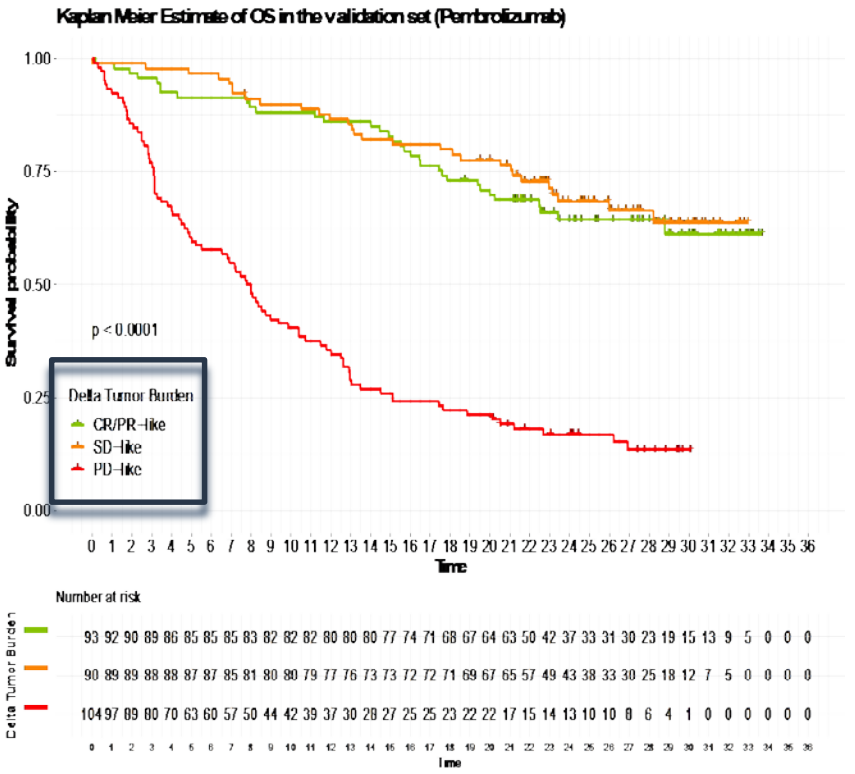
Radiomic Change Analysis – IO - Melanoma



Radiomic Change Analysis – IO - Melanoma







Pseudoprogression – Is there a signature?

- The antitumor activity of Pembrolizumab is difficult to evaluate due to atypical patterns of response and progression

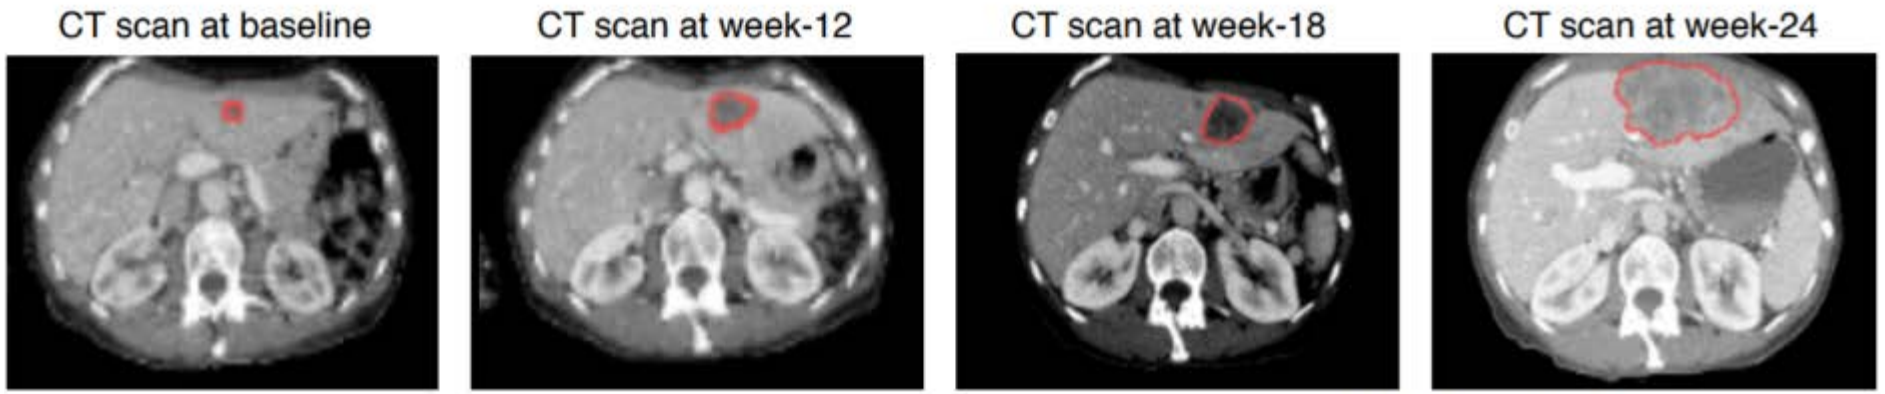
- Patterns seen:
  - Late Pseudoprogression
  - Early Pseudoprogression
  - Heterogeneous progression
  - Long term partial responders

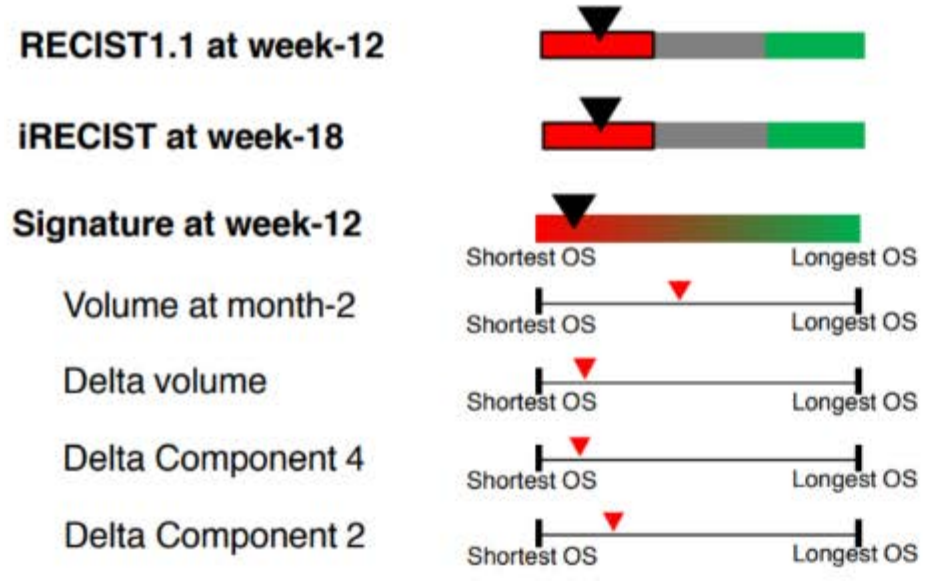
Key Features – Biologic Relevance

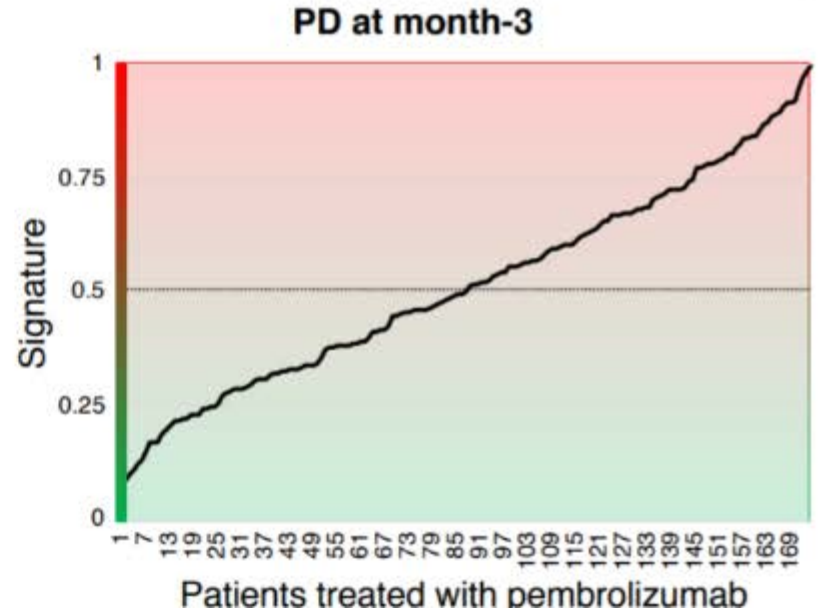
Immunotherapy

Key Features – Biologic Relevance

Progression per RECIST 1.1 at week-12 confirmed by iRECIST at week-18







Key Features – Biologic Relevance

Progression per RECIST 1.1 at week-12 reclassified as pseudoprogression by iRECIST at week-18
